Layout #1 - Navbar
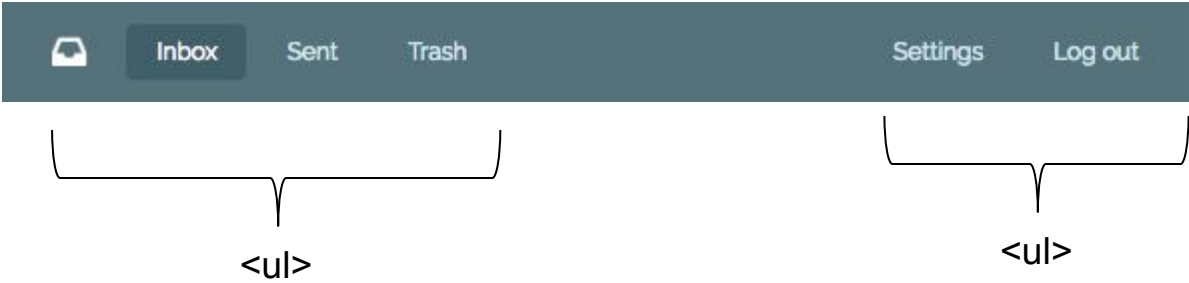

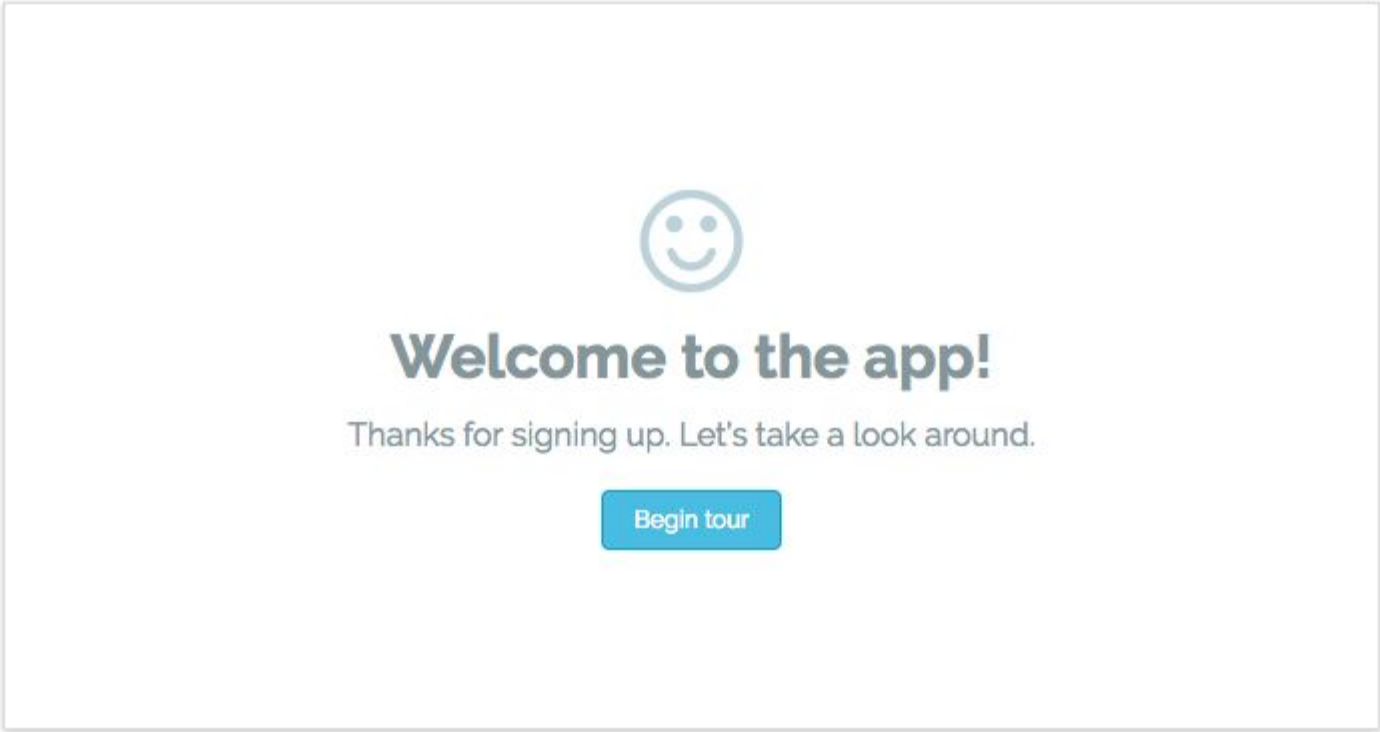

Build the micro-layout below using flexbox. Hint: Each ul should be a flex-item. You can use FontAwesome for the icon. Your navbar should span the width of the viewport window.

Layout #2 - Perfectly Center

In this layout, make your container 100vw and 100vh. Then center the copy both vertically and horizontally.

Layout #3 - Equal Heights

For this layout you can use your own copy. Just be sure that the column widths are equal. More importantly, the height of each column should be equal to the column with the greatest amount of content.
